Red Hat Enterprise Linux Release 9.2 Manual Pages on 'zcmp.1' command

$ man zcmp.1

ZDIFF(1)   General Commands Manual   ZDIFF(1)

NAME

    zcmp, zdiff - compare compressed files

SYNOPSIS

    zcmp [cmp_options] file1 [file2]

    zdiff [diff_options] file1 [file2]

DESCRIPTION

    The zcmp and zdiff commands are used to invoke the cmp or the diff pro?

    gram on files compressed via gzip. All options specified are passed

    directly to cmp or diff. If only file1 is specified, it is compared to

    the uncompressed contents of file1.gz. If two files are specified,

    their contents (uncompressed if necessary) are fed to cmp or diff. The

    input files are not modified. The exit status from cmp or diff is pre?

    served.

SEE ALSO

    cmp(1), diff(1), zmore(1), zgrep(1), znew(1), zforce(1), gzip(1),

    gzexe(1)

BUGS

    Messages from the cmp or diff programs may refer to file names such as

    "-" instead of to the file names specified.
