$ man cvtsudoers.1

CVTSUDOERS(1)   BSD General Commands Manual   CVTSUDOERS(1)

NAME

    cvtsudoers ? convert between sudoers file formats

SYNOPSIS

    cvtsudoers [-ehMpV] [-b dn] [-c conf_file] [-d deftypes]

        [-f output_format] [-i input_format] [-I increment]

        [-m filter] [-o output_file] [-O start_point] [-P padding]

        [-s sections] [input_file]

DESCRIPTION

    cvtsudoers can be used to convert between sudoers security policy file

    formats. The default input format is sudoers. The default output format

    is LDIF. It is only possible to convert a sudoers file that is syntacti?

    cally correct.

    If no input_file is specified, or if it is ?-?, the policy is read from

    the standard input. By default, the result is written to the standard

    output.

    The options are as follows:

    -b dn, --base=dn

The base DN (distinguished name) that will be used when per?

forming LDAP queries. Typically this is of the form

ou=SUDOers,dc=my-domain,dc=com for the domain my-domain.com.

If this option is not specified, the value of the

SUDOERS_BASE environment variable will be used instead. Only

necessary when converting to LDIF format.

-c conf_file, --config=conf_file

Specify the path to the configuration file. Defaults to

/etc/cvtsudoers.conf.

-d deftypes, --defaults=deftypes

Only convert Defaults entries of the specified types. One or

more Defaults types may be specified, separated by a comma

(?,?). The supported types are:

all   All Defaults entries.

global   Global Defaults entries that are applied regardless

         of user, runas, host or command.

user   Per-user Defaults entries.

runas   Per-runas user Defaults entries.

host   Per-host Defaults entries.

command   Per-command Defaults entries.

See the Defaults section in sudoers(5) for more information.

If the -d option is not specified, all Defaults entries will

be converted.

-e, --expand-aliases

Expand aliases in input_file. Aliases are preserved by de?

fault when the output format is JSON or sudoers.

-f output_format, --output-format=output_format

Specify the output format (case-insensitive). The following

formats are supported:

JSON   JSON (JavaScript Object Notation) files are usually

         easier for third-party applications to consume than

         the traditional sudoers format. The various values

         have explicit types which removes much of the ambi?

guity of the sudoers format.

LDIF   LDIF (LDAP Data Interchange Format) files can be
imported into an LDAP server for use with
sudoers.ldap(5).

Conversion to LDIF has the following limitations:

? Command, host, runas and user-specific Defaults
lines cannot be translated as they don't have an
equivalent in the sudoers LDAP schema.

? Command, host, runas and user aliases are not
supported by the sudoers LDAP schema so they are
expanded during the conversion.

sudoers   Traditional sudoers format. A new sudoers file
will be reconstructed from the parsed input file.
Comments are not preserved and data from any in?
clude files will be output inline.

-h, --help Display a short help message to the standard output and exit.

-i input_format, --input-format=input_format

Specify the input format. The following formats are sup?
ported:

LDIF   LDIF (LDAP Data Interchange Format) files can be
exported from an LDAP server to convert security
policies used by sudoers.ldap(5). If a base DN
(distinguished name) is specified, only sudoRole
objects that match the base DN will be processed.
Not all sudoOptions specified in a sudoRole can be
translated from LDIF to sudoers format.

sudoers   Traditional sudoers format. This is the default
input format.

-I increment, --increment=increment

When generating LDIF output, increment each sudoOrder attri?
bute by the specified number. Defaults to an increment of 1.

-m filter, --match=filter

Only output rules that match the specified filter. A filter

expression is made up of one or more key = value pairs, sepa‐

rated by a comma (?,?). The key may be ?user?, ?group? or

?host?. For example, user = operator or host = www. An up‐

per-case User_Alias or Host_Alias may be specified as the

?user? or ?host?.

A matching sudoers rule may also include users, groups and

hosts that are not part of the filter. This can happen when

a rule includes multiple users, groups or hosts. To prune

out any non-matching user, group or host from the rules, the

-p option may be used.

By default, the password and group databases are not con‐

sulted when matching against the filter so the users and

groups do not need to be present on the local system (see the

-M option). Only aliases that are referenced by the filtered

policy rules will be displayed.

-M, --match-local

When the -m option is also specified, use password and group

database information when matching users and groups in the

filter. Only users and groups in the filter that exist on

the local system will match, and a user's groups will auto‐

matically be added to the filter. If the -M is not speci‐

fied, users and groups in the filter do not need to exist on

the local system, but all groups used for matching must be

explicitly listed in the filter.

-o output_file, --output=output_file

Write the converted output to output_file. If no output_file

is specified, or if it is ?-?, the converted sudoers policy

will be written to the standard output.

-O start_point, --order-start=start_point

When generating LDIF output, use the number specified by

start_point in the sudoOrder attribute of the first sudoRole

object. Subsequent sudoRole object use a sudoOrder value

generated by adding an increment, see the -I option for de‐

tails. Defaults to a starting point of 1. A starting point

of 0 will disable the generation of sudoOrder attributes in

the resulting LDIF file.

-p, --prune-matches

When the -m option is also specified, cvtsudoers will prune

out non-matching users, groups and hosts from matching en?

tries.

-P padding, --padding=padding

When generating LDIF output, construct the initial sudoOrder

value by concatenating order_start and increment, padding the

increment with zeros until it consists of padding digits.

For example, if order_start is 1027, padding is 3, and

increment is 1, the value of sudoOrder for the first entry

will be 1027000, followed by 1027001, 1027002, etc. If the

number of sudoRole entries is larger than the padding would

allow, cvtsudoers will exit with an error. By default, no

padding is performed.

-s sections, --suppress=sections

Suppress the output of specific sections of the security pol?

icy. One or more section names may be specified, separated

by a comma (?,?). The supported section name are: defaults,

aliases and privileges (which may be shortened to privs).

-V, --version

Print the cvtsudoers and sudoers grammar versions and exit.

Options in the form ?keyword = value? may also be specified in a configu?

ration file, /etc/cvtsudoers.conf by default. The following keywords are

recognized:

defaults = deftypes

See the description of the -d command line option.

expand_aliases = yes | no

See the description of the -e command line option.

input_format = ldif | sudoers

See the description of the -i command line option.

match = filter

    See the description of the -m command line option.

order_increment = increment

    See the description of the -I command line option.

order_start = start_point

    See the description of the -O command line option.

output_format = json | ldif | sudoers

    See the description of the -f command line option.

padding = padding

    See the description of the -P command line option.

prune_matches = yes | no

    See the description of the -p command line option.

sudoers_base = dn

    See the description of the -b command line option.

suppress = sections

    See the description of the -s command line option.

Options on the command line will override values from the configuration

file.

FILES

/etc/cvtsudoers.conf   default configuration for cvtsudoers

EXAMPLES

Convert /etc/sudoers to LDIF (LDAP Data Interchange Format) where the

ldap.conf file uses a sudoers_base of my-domain,dc=com, storing the re?

sult in sudoers.ldif:

    $ cvtsudoers -b ou=SUDOers,dc=my-domain,dc=com -o sudoers.ldif \

        /etc/sudoers

Convert /etc/sudoers to JSON format, storing the result in sudoers.json:

    $ cvtsudoers -f json -o sudoers.json /etc/sudoers

Parse /etc/sudoers and display only rules that match user ambrose on host

hastur:

    $ cvtsudoers -f sudoers -m user=ambrose,host=hastur /etc/sudoers

Same as above, but expand aliases and prune out any non-matching users

and hosts from the expanded entries.

```
$ cvtsudoers -ep -f sudoers -m user=ambrose,host=hastur /etc/sudoers
```

Convert sudoers.ldif from LDIF to traditional sudoers format:

```
$ cvtsudoers -i ldif -f sudoers -o sudoers.new sudoers.ldif
```
