DNF-GROUPS-MANAGER(8)   dnf-plugins-core   DNF-GROUPS-MANAGER(8)

NAME

    dnf-groups-manager - DNF groups-manager Plugin

    Create and edit groups repository metadata files.

SYNOPSIS

    dnf   groups-manager [options] [package-name-spec [package-name-spec

    ...]]

DESCRIPTION

    groups-manager plugin is used to create or edit a group metadata file

    for a repository. This is often much easier than writing/editing the

    XML by hand. The groups-manager can load an entire file of groups meta?

    data and either create a new group or edit an existing group and then

    write all of the groups metadata back out.

ARGUMENTS

    <package-name-spec>

        Package to add to a group or remove from a group.

OPTIONS

    All general DNF options are accepted, see Options in dnf(8) for de?

tails.

--load=<path_to_comps.xml>

Load the groups metadata information from the specified file be?
fore performing any operations. Metadata from all files are
merged together if the option is specified multiple times.

--save=<path_to_comps.xml>

Save the result to this file. You can specify the name of a file
you are loading from as the data will only be saved when all the
operations have been performed. This option can also be speci?
fied multiple times.

--merge=<path_to_comps.xml>

This is the same as loading and saving a file, however the
"merge" file is loaded before any others and saved last.

--print

Also print the result to stdout.

--id=<id>

The id to lookup/use for the group. If you don't specify an
<id>, but do specify a name that doesn't refer to an existing
group, then an id for the group is generated based on the name.

-n <name>, --name=<name>

The name to lookup/use for the group. If you specify an existing
group id, then the group with that id will have it's name
changed to this value.

--description=<description>

The description to use for the group.

--display-order=<display_order>

Change the integer which controls the order groups are presented
in, for example in dnf grouplist.

--translated-name=<lang:text>

A translation of the group name in the given language. The syn?
tax is lang:text. Eg. en:my-group-name-in-english

--translated-description=<lang:text>

A translation of the group description in the given language.

The syntax is lang:text. Eg. en:my-group-description-in-english.

--user-visible

Make the group visible in dnf grouplist (this is the default).

--not-user-visible

Make the group not visible in dnf grouplist.

--mandatory

Store the package names specified within the mandatory section

of the specified group, the default is to use the default sec?

tion.

--optional

Store the package names specified within the optional section of

the specified group, the default is to use the default section.

--remove

Instead of adding packages remove them. Note that the packages

are removed from all sections (default, mandatory and optional).

--dependencies

Also include the names of the direct dependencies for each pack?

age specified.
