DESCRIPTION

These functions return the error function of x , defined as

$$\operatorname{erf}(x) = \frac{2}{\sqrt{\pi}} \int_0^x \exp(-t^2) dt$$

RETURN VALUE

On success, these functions return the value of the error function of x , a value in the range $[-1, 1]$.

If x is a NaN, a NaN is returned.

If x is $+0$ (-0), $+0$ (-0) is returned.

If x is positive infinity (negative infinity), $+1$ (-1) is returned.

If x is subnormal, a range error occurs, and the return value is $2x/\sqrt{\pi}$.

ERRORS

See `math_error(7)` for information on how to determine whether an error has occurred when calling these functions.

The following errors can occur:

Range error: result underflow (x is subnormal)

An underflow floating-point exception (`FE_UNDERFLOW`) is raised.

These functions do not set `errno`.
