DESCRIPTION

The `ffs()` function returns the position of the first (least significant) bit set in the word *i*. The least significant bit is position 1 and the most significant position is, for example, 32 or 64. The functions `ffsll()` and `ffsl()` do the same but take arguments of possibly different size.

RETURN VALUE

These functions return the position of the first bit set, or 0 if no bits are set in *i*.

ATTRIBUTES

CONFORMING TO

`ffs()`: POSIX.1-2001, POSIX.1-2008, 4.3BSD.

The `ffsl()` and `ffsll()` functions are glibc extensions.

NOTES

BSD systems have a prototype in `<string.h>`.
