$ man foomatic-ppd-options.1

FOOMATIC-PPD-OPTIONS(1)   General Commands Manual   FOOMATIC-PPD-OPTIONS(1)

NAME

    foomatic-ppd-options - show the PPD options

SYNOPSIS

    foomatic-ppd-options [-d=debuglevel] [ppdfiles]

DESCRIPTION

    The foomatic-ppd-options program reads the specified PPD files or stdin

    and decodes the PPD file to produce a list of options. This is really

    just a text based version of other print configuration tools.

    The output format consists of a set of lines, each starting with a key?

    word, followed by a set of options and the default value. For example:

        makemodel = Tektronix Phaser 350 Foomatic/Postscript (recommended)

        name=PageSize; default=Letter; options=Letter (US Letter), \

          A4 (A4), 11x17 (11x17), A3 (A3), A5 (A5), B5 (B5 \(JIS\)),...

        name=PageRegion; default=Letter; options=Letter (US Letter), A4 (A4), ...

    Each option starts with the name tag, followed by a default value (if

    any), followed by the set of options and a comment describing them.

    Punctuation in the comment is escaped.

Options

-ddebuglevel

Set the debug level. 0 disables debug messages.

[files]

The list of PPD files to read for options. A '-' causes STDIN to

be read.

EXIT STATUS

foomatic-ppd-options exits with a 0 status if successful, and nonzero

if an error. An error message is also printed on standard error

(STDERR).
