Rocky Enterprise Linux 9.2 Manual Pages on command 'getdents.2'

$ man getdents.2

GETDENTS(2)   Linux Programmer's Manual   GETDENTS(2)

NAME

   getdents, getdents64 - get directory entries

SYNOPSIS

   long getdents(unsigned int fd, struct linux_dirent *dirp,

        unsigned int count);

   #define _GNU_SOURCE   /* See feature_test_macros(7) */

   #include <dirent.h>

   ssize_t getdents64(int fd, void *dirp, size_t count);

   Note: There is no glibc wrapper for getdents(); see NOTES.

DESCRIPTION

   These are not the interfaces you are interested in. Look at readdir(3)

   for the POSIX-conforming C library interface. This page documents the

   bare kernel system call interfaces.

 getdents()

   The system call getdents() reads several linux_dirent structures from

   the directory referred to by the open file descriptor fd into the buf?

   fer pointed to by dirp. The argument count specifies the size of that

buffer.

The linux_dirent structure is declared as follows:

```
struct linux_dirent {
    unsigned long  d_ino;     /* Inode number */
    unsigned long  d_off;     /* Offset to next linux_dirent */
    unsigned short d_reclen;  /* Length of this linux_dirent */
    char           d_name[];  /* Filename (null-terminated) */
                    /* length is actually (d_reclen - 2 -
                       offsetof(struct linux_dirent, d_name)) */
    /*
    char           pad;       // Zero padding byte
    char           d_type;    // File type (only since Linux
                              // 2.6.4); offset is (d_reclen - 1)
    */
}
```

d_ino is an inode number. d_off is the distance from the start of the

directory to the start of the next linux_dirent. d_reclen is the size

of this entire linux_dirent. d_name is a null-terminated filename.

d_type is a byte at the end of the structure that indicates the file

type. It contains one of the following values (defined in <dirent.h>):

DT_BLK   This is a block device.

DT_CHR   This is a character device.

DT_DIR   This is a directory.

DT_FIFO   This is a named pipe (FIFO).

DT_LNK   This is a symbolic link.

DT_REG   This is a regular file.

DT_SOCK   This is a UNIX domain socket.

DT_UNKNOWN The file type is unknown.

The d_type field is implemented since Linux 2.6.4. It occupies a space

that was previously a zero-filled padding byte in the linux_dirent

structure.   Thus, on kernels up to and including 2.6.3, attempting to

access this field always provides the value 0 (DT_UNKNOWN).

Currently, only some filesystems (among them: Btrfs, ext2, ext3, and

ext4) have full support for returning the file type in d_type. All ap‐

plications must properly handle a return of DT_UNKNOWN.

getdents64()

The original Linux getdents() system call did not handle large filesys‐

tems and large file offsets. Consequently, Linux 2.4 added get‐

dents64(), with wider types for the d_ino and d_off fields. In addi‐

tion, getdents64() supports an explicit d_type field.

The getdents64() system call is like getdents(), except that its second

argument is a pointer to a buffer containing structures of the follow‐

ing type:

```
struct linux_dirent64 {
    ino64_t      d_ino;   /* 64-bit inode number */
    off64_t      d_off;   /* 64-bit offset to next structure */
    unsigned short d_reclen; /* Size of this dirent */
    unsigned char  d_type;   /* File type */
    char         d_name[]; /* Filename (null-terminated) */
};
```

RETURN VALUE

On success, the number of bytes read is returned. On end of directory,

0 is returned. On error, -1 is returned, and errno is set appropri‐

ately.

ERRORS

EBADF Invalid file descriptor fd.

EFAULT Argument points outside the calling process's address space.

EINVAL Result buffer is too small.

ENOENT No such directory.

ENOTDIR

File descriptor does not refer to a directory.

CONFORMING TO

SVr4.

NOTES

Library support for getdents64() was added in glibc 2.30; there is no

glibc wrapper for getdents(). Calling getdents() (or getdents64() on

earlier glibc versions) requires the use of syscall(2). In that case
you will need to define the linux_dirent or linux_dirent64 structure
yourself.

Probably, you want to use readdir(3) instead of these system calls.

These calls supersede readdir(2).

EXAMPLES

The program below demonstrates the use of getdents(). The following
output shows an example of what we see when running this program on an
ext2 directory:

```
$ ./a.out /testfs/
--------------- nread=120 ---------------
inode#   file type  d_reclen  d_off   d_name
     2  directory    16        12  .
     2  directory    16        24  ..
    11  directory    24        44  lost+found
    12  regular      16        56  a
228929  directory    16        68  sub
 16353  directory    16        80  sub2
130817  directory    16      4096  sub3
```

Program source

```c
#define _GNU_SOURCE
#include <dirent.h>     /* Defines DT_* constants */
#include <fcntl.h>
#include <stdint.h>
#include <stdio.h>
#include <unistd.h>
#include <stdlib.h>
#include <sys/stat.h>
#include <sys/syscall.h>
#define handle_error(msg) \
        do { perror(msg); exit(EXIT_FAILURE); } while (0)
struct linux_dirent {
    unsigned long  d_ino;
```

```c
        off_t          d_off;

        unsigned short d_reclen;

        char           d_name[];

};

#define BUF_SIZE 1024

int

main(int argc, char *argv[])

{

    int fd;

    long nread;

    char buf[BUF_SIZE];

    struct linux_dirent *d;

    char d_type;

    fd = open(argc > 1 ? argv[1] : ".", O_RDONLY | O_DIRECTORY);

    if (fd == -1)

        handle_error("open");

    for (;;) {

        nread = syscall(SYS_getdents, fd, buf, BUF_SIZE);

        if (nread == -1)

            handle_error("getdents");

        if (nread == 0)

            break;

        printf("--------------- nread=%d ---------------\n", nread);

        printf("inode#    file type  d_reclen  d_off   d_name\n");

        for (long bpos = 0; bpos < nread;) {

            d = (struct linux_dirent *) (buf + bpos);

            printf("%8ld  ", d->d_ino);

            d_type = *(buf + bpos + d->d_reclen - 1);

            printf("%-10s ", (d_type == DT_REG) ?  "regular" :

                        (d_type == DT_DIR) ?  "directory" :

                        (d_type == DT_FIFO) ? "FIFO" :

                        (d_type == DT_SOCK) ? "socket" :

                        (d_type == DT_LNK) ?  "symlink" :
```

```
                     (d_type == DT_BLK) ?  "block dev" :

                     (d_type == DT_CHR) ?  "char dev" : "???");
            printf("%4d %10jd  %s\n", d->d_reclen,

                   (intmax_t) d->d_off, d->d_name);

            bpos += d->d_reclen;

        }

    }

    exit(EXIT_SUCCESS);

}
```
