GETNETENT_R(3) Linux Programmer's Manual GETNETENT_R(3)

NAME

getnetent_r, getnetbyname_r, getnetbyaddr_r - get network entry (reen?
trant)

SYNOPSIS

```
#include <netdb.h>

int getnetent_r(struct netent *result_buf, char *buf,
               size_t buflen, struct netent **result,
               int *h_errnop);

int getnetbyname_r(const char *name,
                  struct netent *result_buf, char *buf,
                  size_t buflen, struct netent **result,
                  int *h_errnop);

int getnetbyaddr_r(uint32_t net, int type,
                  struct netent *result_buf, char *buf,
                  size_t buflen, struct netent **result,
                  int *h_errnop);
```

getnetent_r(), getnetbyname_r(), getnetbyaddr_r():

Since glibc 2.19:

`_DEFAULT_SOURCE`

Glibc 2.19 and earlier:

`_BSD_SOURCE` || `_SVID_SOURCE`

DESCRIPTION

The `getnetent_r()`, `getnetbyname_r()`, and `getnetbyaddr_r()` functions are the reentrant equivalents of, respectively, `getnetent(3)`, `getnetbyname(3)`, and `getnetbyaddr(3)`. They differ in the way that the `netent` structure is returned, and in the function calling signature and return value. This manual page describes just the differences from the non-reentrant functions.

Instead of returning a pointer to a statically allocated `netent` structure as the function result, these functions copy the structure into the location pointed to by `result_buf`.

The `buf` array is used to store the string fields pointed to by the returned `netent` structure. (The nonreentrant functions allocate these strings in static storage.) The size of this array is specified in `buf_len`. If `buf` is too small, the call fails with the error `ERANGE`, and the caller must try again with a larger buffer. (A buffer of length 1024 bytes should be sufficient for most applications.)

If the function call successfully obtains a network record, then `*result` is set pointing to `result_buf`; otherwise, `*result` is set to `NULL`.

The buffer pointed to by `h_errnop` is used to return the value that would be stored in the global variable `h_errno` by the nonreentrant versions of these functions.

RETURN VALUE

On success, these functions return 0. On error, they return one of the positive error numbers listed in `ERRORS`.

On error, record not found (`getnetbyname_r()`, `getnetbyaddr_r()`), or end of input (`getnetent_r()`) result is set to `NULL`.

ERRORS

`ENOENT` (`getnetent_r()`) No more records in database.

ERANGE buf is too small. Try again with a larger buffer (and increased buflen).

ATTRIBUTES

For an explanation of the terms used in this section, see attributes(7).

CONFORMING TO

These functions are GNU extensions. Functions with similar names exist on some other systems, though typically with different calling signatures.
