Rocky Enterprise Linux 9.2 Manual Pages on command 'iprsos.8'

\$ man iprsos.8

IPRSOS(8) System Manager's Manual IPRSOS(8)

NAME

iprsos - IBM Power RAID report generator

SYNOPSIS

iprsos

DESCRIPTION

iprsos is used to generate an sosreport-like report by collecting hardware information from the system, along with other system calls such as lspci, lscsi, and others. The information is collected from 'iprconfig' commands and printed on stdin by default. User can specify the log file by -o /path/to/report/file of his/her choice.

FILES

A detailed report file is printed both at stdin and the /path/to/report/file specified by the user, with the information collected from the hardware and system information. If no files are used, the information will be only displayed at stdin.
