$ man ldexpl.3

LDEXP(3)   Linux Programmer's Manual   LDEXP(3)

NAME

　　ldexp, ldexpf, ldexpl - multiply floating-point number by integral

　　power of 2

SYNOPSIS

　　#include <math.h>

　　double ldexp(double x, int exp);

　　float ldexpf(float x, int exp);

　　long double ldexpl(long double x, int exp);

　　Link with -lm.

　Feature Test Macro Requirements for glibc (see feature_test_macros(7)):

　　ldexpf(), ldexpl():

　　　_ISOC99_SOURCE || _POSIX_C_SOURCE >= 200112L

　　　　|| /* Since glibc 2.19: */ _DEFAULT_SOURCE

　　　　|| /* Glibc versions <= 2.19: */ _BSD_SOURCE || _SVID_SOURCE

DESCRIPTION

　　These functions return the result of multiplying the floating-point

　　number x by 2 raised to the power exp.

RETURN VALUE

On success, these functions return x * (2^exp).

If exp is zero, then x is returned.

If x is a NaN, a NaN is returned.

If x is positive infinity (negative infinity), positive infinity (nega?

tive infinity) is returned.

If the result underflows, a range error occurs, and zero is returned.

If the result overflows, a range error occurs, and the functions return

HUGE_VAL, HUGE_VALF, or HUGE_VALL, respectively, with a sign the same

as x.

ERRORS

See math_error(7) for information on how to determine whether an error

has occurred when calling these functions.

The following errors can occur:

Range error, overflow

errno is set to ERANGE. An overflow floating-point exception

(FE_OVERFLOW) is raised.

Range error, underflow

errno is set to ERANGE. An underflow floating-point exception

(FE_UNDERFLOW) is raised.

ATTRIBUTES

For an explanation of the terms used in this section, see at?

tributes(7).

?ldexp(), ldexpf(), ldexpl() ? Thread safety ? MT-Safe ?

??

CONFORMING TO

C99, POSIX.1-2001, POSIX.1-2008.

The variant returning double also conforms to SVr4, 4.3BSD, C89.
