$ man mmdblookup.1

mmdblookup(1)   mmdblookup(1)

NAME

    mmdblookup - a utility to look up an IP address in a MaxMind DB file

SYNOPSIS

    mmdblookup --file [FILE PATH] --ip [IP ADDRESS] [DATA PATH]

DESCRIPTION

    mmdblookup looks up an IP address in the specified MaxMind DB file.

    The record for the IP address is displayed in a JSON-like structure

    with type annotations.

    If an IP's data entry resolves to a map or array, you can provide a

    lookup path to only show part of that data.

    For example, given a JSON structure like this:

      {

        "names": {

          "en": "Germany",

          "de": "Deutschland"

        },

        "cities": ["Berlin", "Frankfurt"]

}

You could look up just the English name by calling mmdblookup with a

lookup path of:

    mmdblookup --file ... --ip ... names en

Or you could look up the second city in the list with:

    mmdblookup --file ... --ip ... cities 1

Array numbering begins with zero (0).

If you do not provide a path to lookup, all of the information for a

given IP will be shown.

OPTIONS

    This application accepts the following options:

    -f, --file

        The path to the MMDB file. Required.

    -i, --ip

        The IP address to look up. Required.

    -v, --verbose

        Turns on verbose output. Specifically, this causes this appli?

        cation to output the database metadata.

    --version

        Print the program's version number and exit.

    -h, -?, --help

        Show usage information.

BUG REPORTS AND PULL REQUESTS

    Please   report   all   issues   to   our   GitHub   issue   tracker

    (https://github.com/maxmind/libmaxminddb/issues). We welcome bug re?

    ports and pull requests. Please note that pull requests are greatly

    preferred over patches.
