### ***Rocky Enterprise Linux 9.2 Manual Pages on command 'nextdownl.3'***

#### ***\$ man nextdownl.3***

NEXTUP(3)           Linux Programmer's Manual           NEXTUP(3)

#### NAME

nextup, nextupf, nextupl, nextdown, nextdownf, nextdownl - return next floating-point number toward positive/negative infinity

#### SYNOPSIS

```
#define _GNU_SOURCE   /* See feature_test_macros(7) */  
  
#include <math.h>  
  
double nextup(double x);  
float nextupf(float x);  
long double nextupl(long double x);  
  
double nextdown(double x);  
float nextdownf(float x);  
long double nextdownl(long double x);  
  
Link with -lm.
```

#### DESCRIPTION

The nextup(), nextupf(), and nextupl() functions return the next representable floating-point number greater than x.

If x is the smallest representable negative number in the corresponding

type, these functions return -0. If x is 0, the returned value is the smallest representable positive number of the corresponding type. If x is positive infinity, the returned value is positive infinity. If x is negative infinity, the returned value is the largest representable finite negative number of the corresponding type.

If x is Nan, the returned value is NaN.

The value returned by nextdown(x) is -nextup(-x), and similarly for the other types.

## RETURN VALUE

See DESCRIPTION.

## VERSIONS

These functions first appeared in glibc in version 2.24.

## ATTRIBUTES

For an explanation of the terms used in this section, see attributes(7).
