$ man podman-completion.1

podman-completion(1)   General Commands Manual   podman-completion(1)

NAME

    podman-completion - Generate shell completion scripts

SYNOPSIS

    podman completion [options]   bash | zsh | fish | powershell

DESCRIPTION

    podman completion generates shell completion scripts for a variety of

    shells. Supported shells are bash, zsh, fish and powershell.

    These script are used by the shell to provide suggestions and complete

    commands when the command is typed and [TAB] is pressed.

    Usually these scripts are automatically installed via the package man?

    ager.

OPTIONS

  --file, -f=file

    Write the generated output to a file.

  --no-desc

    Do not provide description in the completions.

    The default is false.

Installation

BASH

bash-completion has to be installed on the system.

To load the completion script into the current session run:

source <(podman completion bash).

To make it available for all bash sessions run:

podman completion -f /etc/bash_completion.d/podman bash.

ZSH

Shell completion needs to be already enabled in the environment. The

following can be executed:

echo "autoload -U compinit; compinit" >> ~/.zshrc

To make it available for all zsh sessions run:

podman completion -f "${fpath[1]}/_podman" zsh

Once the shell is reloaded the auto-completion should be working.

FISH

To load the completion script into the current session run: podman com?

pletion fish | source

To make it available for all fish sessions run: podman completion -f

~/.config/fish/completions/podman.fish fish

POWERSHELL

To load the completion script into the current session run: podman.exe

completion powershell | Out-String | Invoke-Expression

To make it available in all powershell sessions that a user has, write

the completion output to a file and source that to the user's power?

shell profile. More information about profiles is available with Get-

Help about_Profiles.
