Rocky Enterprise Linux 9.2 Manual Pages on command 'podman-generate-spec.1'

$ man podman-generate-spec.1

podman-generate-spec(1)   General Commands Manual   podman-generate-spec(1)

NAME

   podman-generate-spec - Generate Specgen JSON based on containers or

   pods

SYNOPSIS

   podman generate spec [options] *container | pod

DESCRIPTION

   podman generate spec will generate Specgen JSON from Podman Containers

   and Pods. This JSON can either be printed to a file, directly to the

   command line, or both.

   This JSON can then be used as input for the Podman API, specifically

   for Podman container and pod creation. Specgen is Podman's internal

   structure for formulating new container-related entities.

OPTIONS

  --compact, -c

   Print the output in a compact, one line format. This is useful when

   piping the data to the Podman API

  --filename, -f=filename

Output to the given file.

--name, -n

Rename the pod or container, so that it does not conflict with the ex‐
isting entity. This is helpful when the JSON is to be used before the
source pod or container is deleted.
