Rocky Enterprise Linux 9.2 Manual Pages on command 'podman-init.1'

$ man podman-init.1

podman-init(1)   General Commands Manual   podman-init(1)

NAME

  podman-init - Initialize one or more containers

SYNOPSIS

  podman init [options] container [container...]

  podman container init [options] container [container...]

DESCRIPTION

  Initialize one or more containers. You may use container IDs or names

  as input. Initializing a container performs all tasks necessary for

  starting the container (mounting filesystems, creating an OCI spec,

  initializing the container network) but does not start the container.

  If a container is not initialized, the podman start and podman run com?

  mands will do so automatically prior to starting it. This command is

  intended to be used for inspecting or modifying the container's

  filesystem or OCI spec prior to starting it. This can be used to in?

  spect the container before it runs, or debug why a container is failing

  to run.

OPTIONS

--all, -a

    Initialize all containers. Containers that have already initialized
(including containers that have been started and are running) are ig?
nored.

  --latest, -l

    Instead of providing the container name or ID, use the last created
container.   Note: the last started container could be from other users
of Podman on the host machine. (This option is not available with the
remote Podman client, including Mac and Windows (excluding WSL2) ma?
chines)

EXAMPLE

    Initialize container with a given ID

        podman init 35480fc9d568

    Initialize container with a given name

        podman init test1

    Initialize the latest container created by Podman

        podman init --latest
