\$ man podman-network.1

podman-network(1) General Commands Manual podman-network(1)

NAME

podman-network - Manage Podman networks

SYNOPSIS

podman network subcommand

DESCRIPTION

The network command manages networks for Podman.
Podman supports two network backends Netavark and CNI. Netavark is the default network backend and was added in Podman v4.0. CNI will be deprecated in the future in preference of Netavark. To configure the network backend use the network_backendkey under the [Network] in containers.conf(5). New systems should use netavark by default, to check what backend is used run podman info --format {{.Host.NetworkBackend}}.
All network commands work for both backends but CNI and Netavark use different config files so networks have to be created again after a backend change.

COMMANDS

??

Command	Man Page	Description
connect	podman-network-connect(1)	Connect a container to a net?
work		
create	podman-network-create(1)	Create a Podman network
disconnect	podman-network-disconnect(1)	Disconnect a container from a network
exists	podman-network-exists(1)	Check if the given network exists
inspect	podman-network-inspect(1)	Displays the network configuration for one or more networks
ls	podman-network-ls(1)	Display a summary of networks
prune	podman-network-prune(1)	Remove all unused networks
reload	podman-network-reload(1)	Reload network configuration for containers
rm	podman-network-rm(1)	Remove one or more networks
update	podman-network-update(1)	Update an existing Podman network
