$ man rand_r.3

RAND(3)   Linux Programmer's Manual   RAND(3)

NAME

    rand, rand_r, srand - pseudo-random number generator

SYNOPSIS

    #include <stdlib.h>

    int rand(void);

    int rand_r(unsigned int *seedp);

    void srand(unsigned int seed);

  Feature Test Macro Requirements for glibc (see feature_test_macros(7)):

    rand_r():

      Since glibc 2.24:

        _POSIX_C_SOURCE >= 199506L

      Glibc 2.23 and earlier

        _POSIX_C_SOURCE

DESCRIPTION

    The rand() function returns a pseudo-random integer in the range 0 to

    RAND_MAX inclusive (i.e., the mathematical range [0, RAND_MAX]).

    The srand() function sets its argument as the seed for a new sequence

of pseudo-random integers to be returned by rand(). These sequences are repeatable by calling srand() with the same seed value.

If no seed value is provided, the rand() function is automatically seeded with a value of 1.

The function rand() is not reentrant, since it uses hidden state that is modified on each call. This might just be the seed value to be used by the next call, or it might be something more elaborate. In order to get reproducible behavior in a threaded application, this state must be made explicit; this can be done using the reentrant function rand_r().

Like rand(), rand_r() returns a pseudo-random integer in the range [0, RAND_MAX]. The seedp argument is a pointer to an unsigned int that is used to store state between calls. If rand_r() is called with the same initial value for the integer pointed to by seedp, and that value is not modified between calls, then the same pseudo-random sequence will result.

The value pointed to by the seedp argument of rand_r() provides only a very small amount of state, so this function will be a weak pseudo-ran? dom generator. Try drand48_r(3) instead.

RETURN VALUE

The rand() and rand_r() functions return a value between 0 and RAND_MAX (inclusive). The srand() function returns no value.

ATTRIBUTES

For an explanation of the terms used in this section, see at? tributes(7).

???

CONFORMING TO

The functions rand() and srand() conform to SVr4, 4.3BSD, C89, C99, POSIX.1-2001.   The function rand_r() is from POSIX.1-2001. POSIX.1-2008 marks rand_r() as obsolete.

NOTES

The versions of rand() and srand() in the Linux C Library use the same
random number generator as random(3) and srandom(3), so the lower-order
bits should be as random as the higher-order bits. However, on older
rand() implementations, and on current implementations on different
systems, the lower-order bits are much less random than the higher-or?
der bits. Do not use this function in applications intended to be por?
table when good randomness is needed. (Use random(3) instead.)

EXAMPLES

POSIX.1-2001 gives the following example of an implementation of rand()
and srand(), possibly useful when one needs the same sequence on two
different machines.

```
static unsigned long next = 1;

/* RAND_MAX assumed to be 32767 */

int myrand(void) {

    next = next * 1103515245 + 12345;

    return((unsigned)(next/65536) % 32768);

}

void mysrand(unsigned int seed) {

    next = seed;

}
```

The following program can be used to display the pseudo-random sequence
produced by rand() when given a particular seed.

```
#include <stdlib.h>

#include <stdio.h>

int

main(int argc, char *argv[])

{

    int r, nloops;

    unsigned int seed;

    if (argc != 3) {

        fprintf(stderr, "Usage: %s <seed> <nloops>\n", argv[0]);

        exit(EXIT_FAILURE);
```

```
        }

        seed = atoi(argv[1]);

        nloops = atoi(argv[2]);

        srand(seed);

        for (int j = 0; j < nloops; j++) {

            r =  rand();

            printf("%d\n", r);

        }

        exit(EXIT_SUCCESS);

    }
```
