SG_SAT_PHY_EVENT(8)   SG3_UTILS   SG_SAT_PHY_EVENT(8)

NAME

 sg_sat_phy_event - use ATA READ LOG EXT via a SAT pass-through to fetch

 SATA phy event counters

SYNOPSIS

 sg_sat_phy_event [--ck_cond] [--extend] [--help] [--hex] [--ignore]

 [--len={16|12}] [--raw] [--reset] [--verbose] [--version] DEVICE

DESCRIPTION

 This utility sends an ATA READ LOG EXT with the log page ("address")

 set to 11h to DEVICE and outputs the response. Log page 11h is defined

 in the SATA 2.5 standard and contains phy event counters. Rather than

 send this command directly to the DEVICE, are sent via a SCSI transport

 which is assumed to contain a SCSI to ATA Translation (SAT) Layer

 (SATL). The SATL may be in an operating system driver, in host bus

 adapter firmware or in some external enclosure.

 The SAT standard (SAT ANSI INCITS 431-2007, prior draft: sat-r09.pdf at

 www.t10.org) defines two SCSI "ATA PASS-THROUGH" commands: one using a

 16 byte "cdb" and the other with a 12 byte cdb. This utility defaults

to using the 16 byte cdb variant. SAT-2 is also a standard: SAT-2 ANSI

INCITS 465-2010 and the draft prior to that is sat2r09.pdf . The SAT-3

project has started and the most recent draft is sat3r01.pdf .

OPTIONS

Arguments to long options are mandatory for short options as well.

-c, --ck_cond

sets the CK_COND bit in the ATA PASS-THROUGH SCSI cdb. The de?

fault setting is clear (i.e. 0). When set the SATL should yield

a sense buffer containing a ATA Result descriptor irrespective

of whether the command succeeded or failed. When clear the SATL

should only yield a sense buffer containing a ATA Result de?

scriptor if the command failed.

-e, --extend

sets the EXTEND bit in the ATA PASS-THROUGH SCSI cdb. The de?

fault setting is clear (i.e. 0). When set a 48 bit LBA command

is sent to the device. This option has no effect when --len=12.

-h, --help

outputs the usage message summarizing command line options then

exits. Ignores DEVICE if given.

-H, --hex

outputs the ATA READ LOG EXT response in hex. The default action

(i.e. without any '-H' options) is to output the response in

hex, grouped in 16 bit words (i.e. the ATA standard's prefer?

ence). When given once, the response is output in ASCII hex

bytes (i.e. the SCSI standard's preference). When given twice

(i.e. '-HH') the output is in hex, grouped in 16 bit words, the

same as the default but without a header.

-i, --ignore

usually the phy counter identifier names are decoded. When this

option is given, the numeric value of the identifier is output,

the vendor flag, the data length (in bytes) and the correspond?

ing value.

-l, --len={16|12}

this is the length of the SCSI cdb used for the ATA PASS-THROUGH

commands. The argument can either be 16 or 12. The default is

16. The larger cdb size is needed for 48 bit LBA addressing of

ATA devices. On the other hand some SCSI transports cannot con?

vey SCSI commands longer than 12 bytes.

-r, --raw

output the ATA READ LOG EXT response in binary. The output

should be piped to a file or another utility when this option is

used.   The binary is sent to stdout, and errors are sent to

stderr.

-R, --reset

reset the counters after the current values are returned, de?

coded and displayed.

-v, --verbose

increases the level or verbosity.

-V, --version

print out version string

NOTES

The SCSI ATA PASS-THROUGH (12) command's opcode is 0xa1 and it clashes

with the MMC set's BLANK command used by cd/dvd writers. So a SATL in

front of an ATAPI device that uses MMC (i.e. has peripheral device type

5) probably should treat opcode 0xa1 as a BLANK command and send it

through to the cd/dvd drive. The ATA PASS-THROUGH (16) command's opcode

(0x85) does not clash with anything so it is a better choice.

In the 2.4 series of Linux kernels the DEVICE must be a SCSI generic

(sg) device. In the 2.6 series block devices (e.g. disks and ATAPI

DVDs) can also be specified. For example "sg_inq /dev/sda" will work in

the 2.6 series kernels. From lk 2.6.6 other SCSI "char" device names

may be used as well (e.g. "/dev/st0m"). Prior to lk 2.6.29 USB mass

storage limited sense data to 18 bytes which made the --ck_cond option

yield strange (truncated) results.

EXIT STATUS

The exit status of sg_sat_identify is 0 when it is successful. Other?

wise see the sg3_utils(8) man page.
