\$ man strchr.3

STRCHR(3) Linux Programmer's Manual STRCHR(3)

NAME

strchr, strchr, strchrnul - locate character in string

SYNOPSIS

```
#include <string.h>

char *strchr(const char *s, int c);

char *strrchr(const char *s, int c);

#define _GNU_SOURCE       /* See feature_test_macros(7) */

#include <string.h>

char *strchrnul(const char *s, int c);
```

DESCRIPTION

The `strchr()` function returns a pointer to the first occurrence of the character `c` in the string `s`.

The `strrchr()` function returns a pointer to the last occurrence of the character `c` in the string `s`.

The `strchrnul()` function is like `strchr()` except that if `c` is not found in `s`, then it returns a pointer to the null byte at the end of `s`, rather than `NULL`.

Here "character" means "byte"; these functions do not work with wide or multibyte characters.

RETURN VALUE

The strchr() and strrchr() functions return a pointer to the matched character or NULL if the character is not found. The terminating null byte is considered part of the string, so that if c is specified as '\0', these functions return a pointer to the terminator.

The strchrnul() function returns a pointer to the matched character, or a pointer to the null byte at the end of s (i.e., s+strlen(s)) if the character is not found.

VERSIONS

strchrnul() first appeared in glibc in version 2.1.1.

ATTRIBUTES

For an explanation of the terms used in this section, see attributes(7).
