SYSTEMD-BOOT-CHECK-Nsystemd-boot-checSYSTEMD-BOOT-CHECK-NO-FAILURES.SERVICE(8)

NAME

   systemd-boot-check-no-failures.service, systemd-boot-check-no-failures

   - verify that the system booted up cleanly

SYNOPSIS

   systemd-boot-check-no-failures.service

   /usr/lib/systemd/system-boot-check-no-failures

DESCRIPTION

   systemd-boot-check-no-failures.service is a system service that checks

   whether the system booted up successfully. This service implements a

   very minimal test only: whether there are any failed units on the

   system. This service is disabled by default. When enabled, it is

   ordered before boot-complete.target, thus ensuring the target cannot be

   reached when the system booted up with failed services.

Note that due the simple nature of this check this service is probably

not suitable for deployment in most scenarios. It is primarily useful

only as example for developing more fine-grained checks to order before

boot-complete.target.
