Rocky Enterprise Linux 9.2 Manual Pages on command 'teamnl.8'

\$ man teamnl.8

TEAMNL(8) Team Netlink Interface TEAMNL(8)

NAME

teamnl ? team network device Netlink interface tool

SYNOPSIS

teamnl [-p port_name] [-a array_index] team_device command [com?

mand_args...]

teamnl -h

DESCRIPTION

teamnl is a tool enabling interaction with a team device via the team driver Netlink interface. This tool serves mainly for debugging purposes. Note that it makes no sense to use this tool to change options on team device controlled by a teamd instance.

OPTIONS

-h, --help

Print help text to console and exit.

-p ifname, --port_name ifname

Select per-port option of provided interface name.

-a index, --array_index index

Select array option of provided array index.

COMMAND

ports Dumps team ports.

option Dumps team options.

getoption opt_name

Gets option by selected name.

setoption opt_name opt_value

Sets option by selected name.

monitor opt_style

Monitors changes made to options, ports and interface information. Style can be either "changed" (default) or "all".
