WCTOMB(3) Linux Programmer's Manual WCTOMB(3)

NAME

wctomb - convert a wide character to a multibyte sequence

SYNOPSIS

```
#include <stdlib.h>
```

```
int wctomb(char *s, wchar_t wc);
```

DESCRIPTION

If `s` is not NULL, the `wctomb()` function converts the wide character `wc` to its multibyte representation and stores it at the beginning of the character array pointed to by `s`. It updates the shift state, which is stored in a static anonymous variable known only to the `wctomb()` function, and returns the length of said multibyte representation, that is, the number of bytes written at `s`.

The programmer must ensure that there is room for at least `MB_CUR_MAX` bytes at `s`.

If `s` is NULL, the `wctomb()` function resets the shift state, known only to this function, to the initial state, and returns nonzero if the encoding has nontrivial shift state, or zero if the encoding is state?

less.

RETURN VALUE

If s is not NULL, the wctomb() function returns the number of bytes that have been written to the byte array at s. If wc can not be represented as a multibyte sequence (according to the current locale), -1 is returned.

If s is NULL, the wctomb() function returns nonzero if the encoding has nontrivial shift state, or zero if the encoding is stateless.

CONFORMING TO

POSIX.1-2001, POSIX.1-2008, C99.

NOTES

The behavior of wctomb() depends on the LC_CTYPE category of the current locale.

The function wctomb(3) provides a better interface to the same functionality.
