NAME

XtAppAddBlockHook, XtRemoveBlockHook − register a block hook procedure

SYNTAX

XtBlockHookId XtAppAddBlockHook(XtAppContext *app_context*, XtBlockHookProc *proc*, XtPointer
client_data);

void XtRemoveBlockHook(XtBlockHookId *id*);

ARGUMENTS

app_context	Specifies the application context.
proc	Specifies the block hook procedure.
num_args	Specifies the application-specific data to be passed to the block hook.

DESCRIPTION

XtAppAddBlockHook registers the specified procedure and returns an identifier for it. The hook is called at any time in the future when the Intrinsics are about to block pending some input.

Block hook procedures are removed automatically and the **XtBlockHookId** is destroyed when the application context in which they were added is destroyed.

XtRemoveBlockHook removes the specified block hook procedure from the list in which it was registered.
