

NAME

applygnupgdefaults – Run gpgconf --apply-defaults for all users.

SYNOPSIS

applygnupgdefaults

DESCRIPTION

This script is a wrapper around **gpgconf** to run it with the command **--apply-defaults** for all real users with an existing GnuPG home directory. Admins might want to use this script to update the GnuPG configuration files for all users after */etc/gnupg/gpgconf.conf* has been changed. This allows enforcing certain policies for all users. Note, that this is not a bulletproof way to force a user to use certain options. A user may always directly edit the configuration files and bypass gpgconf.

applygnupgdefaults is invoked by root as:

`applygnupgdefaults`
