NAME

bundle−init − Generates a Gemfile into the current working directory

SYNOPSIS

bundle init [−−gemspec=FILE]

DESCRIPTION

Init generates a default [**Gemfile(5)**][Gemfile(5)] in the current working directory. When adding a [**Gem-file(5)**][Gemfile(5)] to a gem with a gemspec, the **−−gemspec** option will automatically add each dependency listed in the gemspec file to the newly created [**Gemfile(5)**][Gemfile(5)].

OPTIONS

−−gemspec

Use the specified .gemspec to create the [**Gemfile(5)**][Gemfile(5)]

FILES

Included in the default [**Gemfile(5)**][Gemfile(5)] generated is the line **# frozen_string_literal: true**. This is a magic comment supported for the first time in Ruby 2.3. The presence of this line results in all string literals in the file being implicitly frozen.
