## NAME

clog10, clog10f, clog10l - base-10 logarithm of a complex number

# **SYNOPSIS**

#define \_GNU\_SOURCE /\* See feature\_test\_macros(7) \*/
#include <complex.h>

double complex clog10(double complex z);
float complex clog10f(float complex z);
long double complex clog10l(long double complex z);

Link with -lm.

# DESCRIPTION

The call clog10(z) is equivalent to:

clog(z)/log(10)

or equally:

 $\log 10(cabs(c)) + I * carg(c) / \log(10)$ 

The other functions perform the same task for *float* and *long double*.

Note that *z* close to zero will cause an overflow.

#### VERSIONS

These functions first appeared in glibc in version 2.1.

#### **ATTRIBUTES**

For an explanation of the terms used in this section, see **attributes**(7).

Interface	Attribute	Value
clog10(), clog10f(), clog10l()	Thread safety	MT-Safe

# **CONFORMING TO**

These functions are GNU extensions. The identifiers are reserved for future use in C99 and C11.
