

NAME

`deb-systemd-invoke` – wrapper around `systemctl`, respecting `policy-rc.d`

SYNOPSIS

deb-systemd-invoke start|stop|restart *unitfile*...

DESCRIPTION

deb-systemd-invoke is a Debian-specific helper script which asks `/usr/sbin/policy-rc.d` before performing a `systemctl` call.

deb-systemd-invoke is intended to be used from maintscripts to start `systemd` unit files. It is specifically NOT intended to be used interactively by users. Instead, users should run `systemd` and use `systemctl`, or not bother about the `systemd` enabled state in case they are not running `systemd`.
