NAME

faked − daemon that remembers fake ownership/permissions of files manipulated by fakeroot processes.

SYNOPSIS

faked [**−−debug**] [**−−foreground**] [**−−cleanup**] [**−−key** *msg-key*] [**−−load**] [**−−save-file** *save-file*] [**−−port** *TCP-port*]

DESCRIPTION

If a fakeroot process wants to change the ownership of a file, then **faked** is the process that remembers that new owner. If later the same fakeroot process does a stat() for that filename, then the libfakeroot wrapped stat() call will first ask faked for the fake ownership etc of that file, and then report it.

OPTIONS

−−debug
> Print debugging information on stderr.

−−foreground
> Don't fork into the background.

−−cleanup number
> Cleanup the semaphores.

−−key key-number
> Don't allocate a new communication channel, but use channel specified by key. (If the specified channel doesn't exist, it's created).

−−save−file save-file
> Save the environment to save-file on exit.

−−load Load a previously saved environment from the standard input.

−−unknown−is−real
> Use real ownership of previously-unknown files instead of setting them to root:root.

−−port tcp-port
> Use TCP port tcp-port.

BUGS

None so far. Be warned, though: although I've written quite a few much larger (and smaller) programs, I've never written anything that was as tiny as **fakeroot**, had as many bugs as **fakeroot**, and still was as usable as, say, **fakeroot** version 0.0_3, the first version that could be used to build itself.

COPYING

fakeroot is distributed under the GNU General Public License. (GPL 2.0 or greater).
