NAME

git-check-ref-format - Ensures that a reference name is well formed

SYNOPSIS

```
git check-ref-format [--normalize]
    [--[no-]allow-onelevel] [--refspec-pattern]
    <refname>
git check-ref-format --branch <branchname-shorthand>
```

DESCRIPTION

Checks if a given refname is acceptable, and exits with a non-zero status if it is not.

A reference is used in Git to specify branches and tags. A branch head is stored in the **refs/heads** hierarchy, while a tag is stored in the **refs/tags** hierarchy of the ref namespace (typically in **\$GIT_DIR/refs/heads** and **\$GIT_DIR/refs/tags** directories or, as entries in file **\$GIT_DIR/packed-refs** if refs are packed by **git gc**).

Git imposes the following rules on how references are named:

- 1. They can include slash / for hierarchical (directory) grouping, but no slash–separated component can begin with a dot. or end with the sequence **.lock**.
- 2. They must contain at least one /. This enforces the presence of a category like **heads**/, **tags**/ etc. but the actual names are not restricted. If the **—-allow-onelevel** option is used, this rule is waived.
- 3. They cannot have two consecutive dots .. anywhere.
- 4. They cannot have ASCII control characters (i.e. bytes whose values are lower than \040, or \177 **DEL**), space, tilde ~, caret ^, or colon : anywhere.
- 5. They cannot have question—mark ?, asterisk *, or open bracket [anywhere. See the —refspec—pattern option below for an exception to this rule.
- 6. They cannot begin or end with a slash / or contain multiple consecutive slashes (see the **—normalize** option below for an exception to this rule)
- 7. They cannot end with a dot ..
- 8. They cannot contain a sequence @{.
- 9. They cannot be the single character @.
- 10. They cannot contain a \.

These rules make it easy for shell script based tools to parse reference names, pathname expansion by the shell when a reference name is used unquoted (by mistake), and also avoid ambiguities in certain reference name expressions (see **gitrevisions**(7)):

- 1. A double-dot .. is often used as in ref1..ref2, and in some contexts this notation means ref1 ref2 (i.e. not in ref1 and in ref2).
- 2. A tilde and caret are used to introduce the postfix *nth parent* and *peel onion* operation.
- 3. A colon: is used as in **srcref:dstref** to mean "use srcref's value and store it in dstref" in fetch and push operations. It may also be used to select a specific object such as with *git cat-file*: "git cat-file blob v1.3.3:refs.c".
- 4. at-open-brace @{ is used as a notation to access a reflog entry.

With the **—branch** option, the command takes a name and checks if it can be used as a valid branch name (e.g. when creating a new branch). But be cautious when using the previous checkout syntax that may refer to a detached HEAD state. The rule **git check—ref—format—branch \$name** implements may be stricter

than what **git check-ref-format refs/heads/\$name** says (e.g. a dash may appear at the beginning of a ref component, but it is explicitly forbidden at the beginning of a branch name). When run with **—branch** option in a repository, the input is first expanded for the "previous checkout syntax" @{-n}. For example, @{-1} is a way to refer the last thing that was checked out using "git switch" or "git checkout" operation. This option should be used by porcelains to accept this syntax anywhere a branch name is expected, so they can act as if you typed the branch name. As an exception note that, the "previous checkout operation" might result in a commit object name when the N-th last thing checked out was not a branch.

OPTIONS

--[no-]allow-onelevel

Controls whether one–level refnames are accepted (i.e., refnames that do not contain multiple /–separated components). The default is **––no–allow–onelevel**.

--refspec-pattern

Interpret <refname> as a reference name pattern for a refspec (as used with remote repositories). If this option is enabled, <refname> is allowed to contain a single * in the refspec (e.g., foo/bar*/baz or foo/bar*/baz/ but not foo/bar*/baz*).

--normalize

Normalize *refname* by removing any leading slash (/) characters and collapsing runs of adjacent slashes between name components into a single slash. If the normalized refname is valid then print it to standard output and exit with a status of 0, otherwise exit with a non–zero status. (—**print** is a deprecated way to spell —**normalize**.)

EXAMPLES

• Print the name of the previous thing checked out:

```
$ git check-ref-format --branch @ {-1}
```

• Determine the reference name to use for a new branch:

```
$ ref=$(git check-ref-format --normalize "refs/heads/$newbranch")|| { echo "we do not like '$newbranch' as a branch name." >&2; exit 1; }
```
