

**NAME**

**ldrdf** – link RDOFF objects and libraries produced by **rdflib**(1)

**SYNOPSIS**

**ldrdf** [-o *output-file*] *object-file*... [-l*library*...]

**DESCRIPTION**

**ldrdf** is a version of unix **ld**(1) (or DOS LINK) for use with RDOFF files. It is capable of linking RDOFF objects, and libraries produced with the **rdflib**(1) utility.

Libraries must be specified with their path as no search is performed. Modules in libraries are not linked to the program unless they are referred to.

**OPTIONS**

-o *output-file*

Specify an output file. The default output filename is '*aout.rdx*'.

-v Increase verbosity level. Currently 4 verbosity levels are available: default (which only prints error information), normal (which prints information about the produced object, -v), medium (which prints information about what the program is doing, -v -v) and high (which prints all available information, -v -v -v).

-p Change alignment value to which multiple segments combined into a single segment should be aligned (must be either 1, 2, 4, 8, 16, 32 or 256; default is 16).
