

NAME

pasuspender – Temporarily suspend PulseAudio

SYNOPSIS

pasuspender [*options*] -- *PROGRAM* [*ARGUMENTS* ...]

pasuspender --help

pasuspender --version

DESCRIPTION

pasuspender is a tool that can be used to tell a local PulseAudio sound server to temporarily suspend access to the audio devices, to allow other applications access them directly. *pasuspender* will suspend access to the audio devices, fork a child process, and when the child process terminates, resume access again.

Make sure to include -- in your *pasuspender* command line before passing the subprocess command line (as shown above). Otherwise *pasuspender* itself might end up interpreting the command line switches and options you intended to pass to the subprocess.

OPTIONS

-h | --help

Show help.

--version

Show version information.

-s | --server=*SERVER*

Specify the sound server to connect to.
