NAME

ppmflash - brighten a picture up to complete white-out

SYNOPSIS

ppmflash *flashfactor* [*ppmfile*]

DESCRIPTION

Reads a portable pixmap as input. Increases its brightness by the specified flashfactor up to a total white-out image. The flashfactor may be in the range from 0.0 (original picture's brightness) to 1.0 (full white-out, The Second After).

As *pnmgamma* does not do the brightness correction in the way I wanted it, this small program was written.

This program is similar to *ppmbrighten* , but not exactly the same.
