

NAME

setvtrgb – set the virtual terminal RGB colors

SYNOPSIS

setvtrgb *-h* *-V* *vga* *FILE* *-*

DESCRIPTION

The *setvtrgb* command takes a single argument, either the string **vga** , or a path to a file containing the red, green, and blue colors to be used by the Linux virtual terminals.

If you use the **FILE** parameter, **FILE** should be exactly 3 lines of 16 comma-separated decimal values for RED, GREEN, and BLUE.

To seed a valid **FILE** :

```
cat /sys/module/vt/parameters/default_{red,grn,blu} > FILE
```

And then edit the values in **FILE**

OTHER OPTIONS

- h** Prints usage message and exits.
- V** Prints version number and exists.

AUTHOR

The utility is written by Alexey Gladkov, Seth Forshee, Dustin Kirkland.
