## NAME

udisks2.conf − The udisks2 configuration file

## DESCRIPTION

The udisks project provides additional functionality via pluggable modules. These plugins can be inserted into the daemon either by D−Bus call **org.freedesktop.UDisks2.Manager.EnableModules()** or by running the udisks daemon with **−−force−load−modules** command line option.

It is also possible to configure the modules loading behavior via the configuration file placed at */etc/udisks/udisks2.conf*.

## CONFIGURATION FILE

The default configuration file **udisks2.conf** looks like this:

```
[udisks2]
modules=*
modules_load_preference=ondemand

[defaults]
encryption=luks1
```

**modules = <string list>**

This variable controlls what modules should be loaded. It may contain either a comma−separated list of modules to load or a single asterisk which stands for all the modules.

**modules_load_preference = ondemand|onstartup**

This key tells udisksd when to load the plugins: either at startup or on demand by D−Bus **org.freedesktop.UDisks2.Manager.EnableModules**().

**encryption = luks1|luks2**

This variable controls which encryption technology will be used by default when creating an encrypted filesystem.
